

# PowerShell tiPS Module

 lazyadmin.nl/powershell/tips-module

September 23, 2024

With PowerShell, you can truly learn something new every day if you want. There are tons of great modules, tips, and tricks that we can use. But how do you find them? This is where the new module, PowerShell tiPS comes in.

tiPS will show a PowerShell-related tip every time you open PowerShell, just like some software programs or even games do on their loading screens. This provides a really low-effort way to learn new things about PowerShell.

```
PS D:\Scripts\LazyAdmin> tips
----- Use Out-ConsoleGridView for a cross-platform grid view [Module] -----
The Out-GridView cmdlet is very useful, but it only works on Windows. The Microsoft.PowerShell.ConsoleGuiTools module provides a cross-platform alternative called Out-ConsoleGridView. Rather than opening a new window, it displays the grid view in the current terminal window.

You can use Out-ConsoleGridView to display a table of data that the user is able to interactively navigate. The user can select rows from the list that can be saved to a variable or piped to another command, allowing you to perform actions on the selected rows.
Example:
Install-Module Microsoft.PowerShell.ConsoleGuiTools

Get-Process | Out-ConsoleGridView -Title "Select processes to return" | Select-Object -Property ProcessName, Id
More information:
https://github.com/PowerShell/GraphicalTools/
Tip submitted by: Daniel Schroeder (deadlydog)
-----
PS D:\Scripts\LazyAdmin> |
```

The module is community-driven, meaning that everybody can contribute by sharing helpful and valuable tips.

## Instal and Configure tiPS

To install the module, we can simply use the Install-Module cmdlet to install it from the PowerShell Gallery. I recommend installing it in the current user scope so that the module is only available in your user account.

# Install the module

```
Install-Module -Name tiPS -Scope CurrentUser
```

The next step is to add the module to your PowerShell profile. You can do this manually, but it is even easier to use the cmdlet below to add it automatically for you:

# Add the module to your PowerShell profile

```
Add-TiPSImportToPowerShellProfile
```

## Where can I send the Free PowerShell cheat sheet to?

---

At this point, the module is installed and automatically loaded when you open PowerShell. But it won't show tips yet. To do this, we will need to configure when we want to see the actual tips. We have a few options for this:

- EverySessions
- Daily
- Weekly
- Never

To start, I recommend using Daily. If you have seen most of the tips, you can always switch back to weekly. You can set the configuration with:

```
Set-TiPSConfiguration -AutomaticallyWritePowerShellTip Daily
```

The last step is to configure how often you want to update the module. Regularly updating the module is needed to get new tips. You can see it to update Daily, Weekly, BiWeekly, monthly, or never.

```
Set-TiPSConfiguration -AutomaticallyUpdateModule Weekly
```

## Using the Module

---

The PowerShell tips will automatically show up after you open a PowerShell window. But you can of course also request a tip when you want. Simply use the cmdlet `Write-PowerShellTip` or it's alias `tips` to view a tip.

You can also use the cmdlet `Get-PowerShellTip`, this will return the tip as an object. This way you can pipe the tip into another cmdlet if you want.

The newest tips are shown first by default. But we can also change this. We can set it to view the oldest tips first or display them in a random order:

```
Set-TiPSConfiguration -TipRetrievalOrder
```

To view your current configuration, you can use the cmdlet `Get-TiPSConfiguration`.

## Wrapping Up

---

The PowerShell tiPS module is community-driven, so if you have a great tip or trick to share, then make sure that you check out the [contribute section here](#) at the Github repository.

I personally find the tiPS module a great initiative, it's an easy way to learn new PowerShell tips. Make sure that you also check out the [5 Must have PowerShell modules](#) and of course the [free PowerShell Cheat Sheet!](#)
