## Professional Software for Windows Services / 24x7 Operation

## The mystery: “The service did not start due to a login failure”

The screenshot shows the "Event Properties - Event 7000, Service Control Manager" window. The "General" tab is selected, displaying the event details. The main text area contains the message: "The [redacted] service failed to start due to the following error:  
The service did not start due to a logon failure." Below this, the event properties are listed in two columns. On the right side of the window, there are up and down arrow icons. At the bottom, there are "Copy" and "Close" buttons.

**Event Properties - Event 7000, Service Control Manager**

**General Details**

The [redacted] service failed to start due to the following error:  
The service did not start due to a logon failure.

Log Name:	System		
Source:	Service Control Manager	Logged:	1/31/2016 8:48:45 AM
Event ID:	7000	Task Category:	None
Level:	Error	Keywords:	Classic
User:	N/A	Computer:	[redacted]
OpCode:	Info		
More Information:	<a href="#">Event Log Online Help</a>		

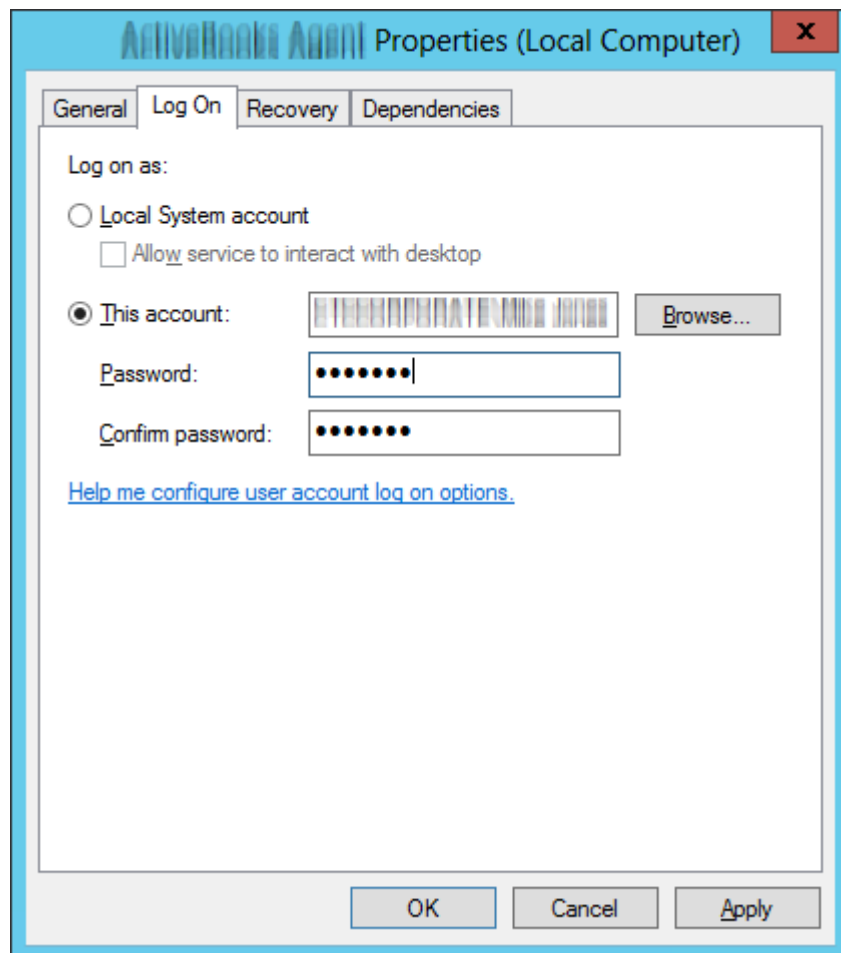

**Copy Close**

 $\frac{1}{8}$

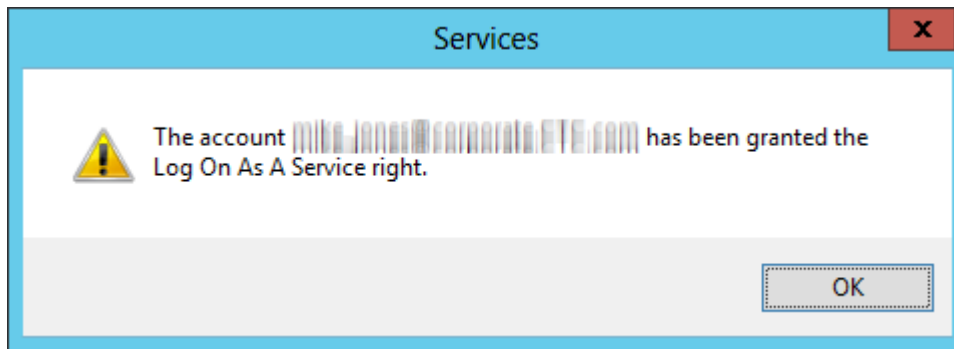

The service account's password had not changed, and the user had no problem logging into the server interactively. Why was the windows service failing to login?

Luckily we were able to get the service going again by re-entering the user's password:

When doing so, we noticed that the "Log on as a service" right had to be granted again. Very suspicious...

But a mere 24 hours later, the problem resurfaced! Once again, the service failed to start after a reboot.

## The problem: Group Policy overwriting Local Policy

---

The message about the “Log on as a service” right lead us to the root of the problem.

Entering the password in services.msc updated the user’s rights in the machine’s Local Group Policy — a collection of settings that define how the system will behave for the PC’s users. However, since the user and server were part of a domain, those local settings were **periodically overwritten by the domain’s group policy**, which had **not** been updated with the new permission. And because the necessary permission “disappeared” on the machine, the service failed the next time it tried to start.

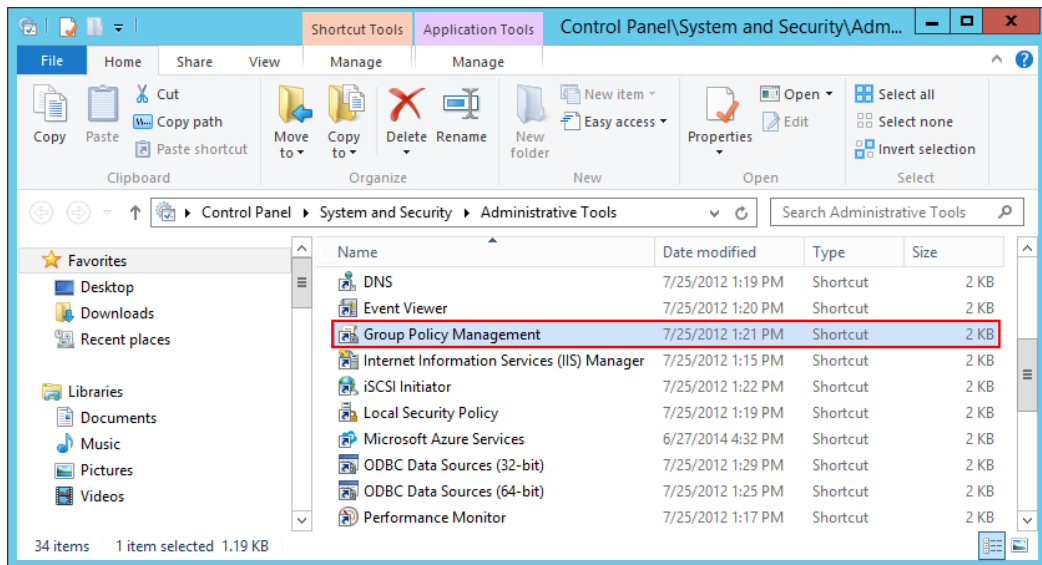

## The solution: Modify the Domain Group Policy

---

To fix the problem, we must update the domain group policy and explicitly give the service user the “Log on as a service” right. To do so:

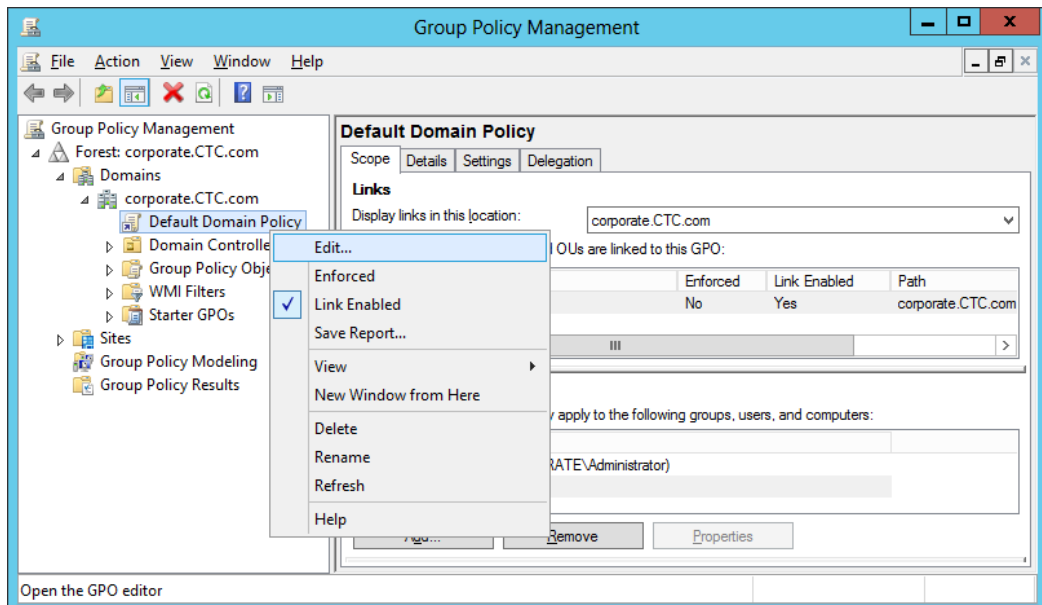

1. Start the **Group Policy Management** application.

Open Control Panel, navigate to **System and Security > Administrative Tools**, and double-click **Group Policy Management** on the left.

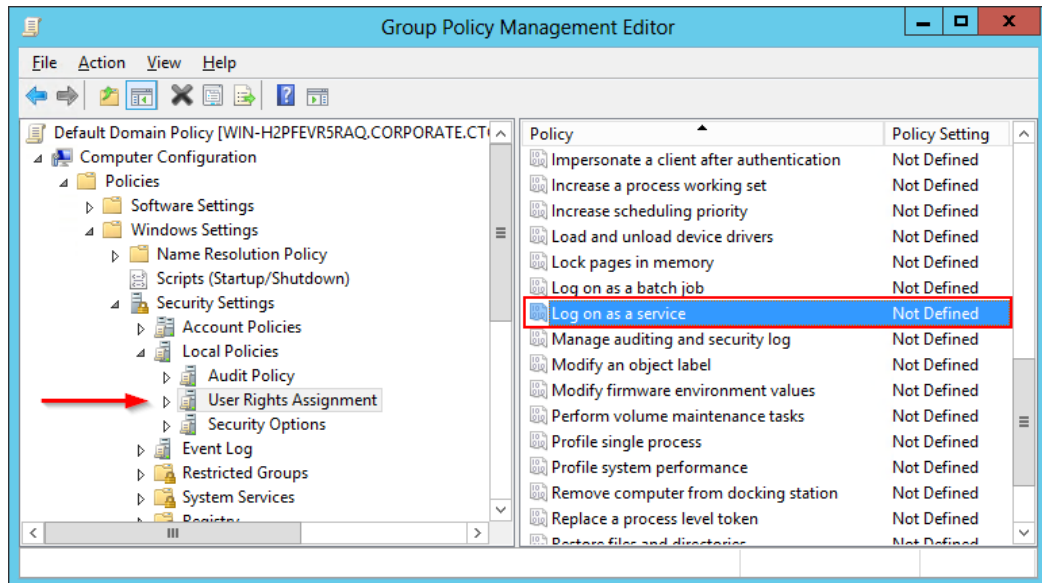

(Note: Don't search for "group" in Control Panel. That will lead you to the "Edit group policy" link, which opens the **local** group policy!)

2. Find your default domain policy on the left. Right-click it and select **Edit** to bring up the **Group Policy Management Editor** window.

3. On the left, navigate to **Computer Configuration > Policies > Windows Settings > Security Settings > Local Policies > User Rights Assignment** and select the **Log on as a service** entry on the right.

4. Double-click **Log on as a service** to bring up its **Properties** window.

Add the user running your windows service to the list and click OK to record the change.

Next time your domain policy is copied to your server, it will bring along the Log on as a service right for the user. You shouldn't encounter the "logon failure" error again!

## A closing note for the folks at Microsoft: A better error message please!

---

Instead of reporting the generic "logon failure", why not be more precise and say something like **"The user doesn't have the necessary rights to start the service"**? You could provide even more guidance by listing the missing rights.

The bottom line is that a helpful error message highlighting the true problem would have led us straight to the solution and avoided a few anxious days for us and our client.
