

Dracarys

mayfly277.github.io/posts/Dracarys-lab

March 8, 2026

DRACARYS is a new lab environment challenge (not for beginners) on GOAD :

<https://github.com/Orange-Cyberdefense/GOAD>

The lab consists of **three machines**: two Windows Server 2025 (one DC and one server) and one Ubuntu 24.04 server. All connected to the same Active Directory domain “dracarys.lab”.

The lab start on the **Linux machine with the .12 IP**, which serves as the starting point for reconnaissance and exploitation. The Ubuntu server is fully integrated into the domain, allowing us to (you will see :p). During the exploitation process, several techniques and tools will need to be used.

The lab is available for the following providers:

- virtualbox
- vmware
- ludus
- proxmox
- aws

- azure

DRACARYS is written as a training challenge where GOAD was written as a lab with a maximum of vulns.

- You should find your way in to get domain admin on the domain dracarys.lab
- Using vagrant user is prohibited of course ^^ -Starting point is on lx01 : .12
- Obviously do not cheat by looking at the passwords and flags in the recipe files, the lab must start without user to full compromise.
- If you use goad previously your ansible requirements may not be up to date. Be sure to do this before the install:

```
source ~/.goad/.venv/bin/activate
cd ~/GOAD/ansible

# if you python is >=3.11
ansible-galaxy install -r
requirements_311.yml
# if you got a python <3.10
ansible-galaxy install -r requirements.yml
```

And install with :

```
./goad.sh -t install -l DRACARYS -p
<provider>
```

or

```
./goad.sh
> set_lab DRACARYS
> set_provider <your_provider>
> set_iprange 192.168.56 # select the one you want and you can skip this with
ludus
> install
```

Once install finish disable vagrant user to avoid using it :

```
./goad.sh
> load
<instance_id>
>
disable_vagrant
```

Now do a reboot of all the machine to avoid unintended secrets stored :

And you are ready to play ! :)

If you need to re-enable vagrant

```
> load  
<instance_id>  
> enable_vagrant
```

If you want to create a write up of the chall, no problem, have fun. Please ping me on X (@M4yFly) or Discord, i will be happy to read it :)

| If you use aws or azure, i recommend you to exploit directly from the jump host to avoid any clock/kerberos issues ;)

Stay tuned for more detailed walkthroughs on specific exploitation techniques within LINUX.
